Antennas And Wave Propagation Model

Ground Wave Propagation. Ground wave propagation of the wave follows the contour of earth. Such a wave is called as direct wave. The wave sometimes bends due to the Earth's magnetic field and gets reflected to the receiver. Such a wave can be termed as reflected wave. The above figure depicts ground wave propagation.

James Henderson – Consultant, Antennas & Propagation “Although sometimes overlooked, antennas are a key component in any radio system and often need to be individually designed for each application. Whatever its specific requirements, each design has to work with the complete product; this means every design has a unique set of challenges.

A theorem about cats: An isotropic antenna can not exist. Antenna Gain $G_T(\varphi, \theta)$ is the amount of power radiated in direction (φ, θ) , relative to an isotropic antenna. Definition: Effective Radiated Power (ERP) is $P_T G_T$ Half-Wave Dipole: A half-wave dipole has antenna gain $G(\varphi, \theta) = 1.64 \frac{2 \cos^2 \theta}{\pi \sin^2 \theta}$

RADIO PROPAGATION MODELS - Wireless Communication

In radio engineering, an antenna is the interface between radio waves propagating through space and electric currents moving in metal conductors, used with a transmitter or receiver. In transmission, a radio transmitter supplies an electric current to the antenna's terminals, and the antenna radiates the energy from the current as electromagnetic waves (radio waves).

When the wave enters the new medium, the speed of propagation will change. In order to match the incident and transmitted wave at the boundary, the transmitted wave will change its direction of propagation. For example, if the new medium has a higher index of refraction, which means the

The difference between the measured RSS and calculated RSS free space wave propagation model was used as input-output data for the system identification. P_r is the received signal strength, P_t is the transmitter power, G_t and G_r are gains of the antennas, L_{fs} is free space losses, and L_{total} is the overall losses of power in the air due to multipath propagation. 2.2.

In telecommunication, the free-space path loss (FSPL) is the attenuation of radio energy between the feedpoints of two antennas that results from the combination of the receiving antenna's capture area plus the obstacle-free, line-of-sight path through free space (usually air). The "Standard Definitions of Terms for Antennas", IEEE Std 145-1993, defines "free-space loss" as "The loss between ...

Radiation is the term used to represent the emission or reception of wave front at the antenna, specifying its strength. In any illustration, the sketch drawn to represent the radiation of an antenna is its radiation pattern. One can simply understand the function and directivity of an antenna by having a look at its radiation pattern.
