Condensed Matter Physics Marder Solutions

These solutions reflect assignments made by Professor David Huse at Princeton University during his semester course on Condensed Matter Physics during the fall of 2006. There are certainly faults in the homeworks (and several solutions that could have been obtained much more directly); but in general, I have tried to correct any mistakes ...

Solutions to Problems in Condensed Matter Physics

Condensed Matter Physics 2. Solutions to the problems in Chapter 7 7.1 Normals to surfaces $r = (x_1, x_2, x_3) = s(t)$ is the parametrization of a curve lying within the surface dened by $f(r) = c$. Since $f(s(t))$ is a constant, the derivative of this function is 0: $f_{ds} ds = f_{dt} dt = 0$ $f_{ds} ds = -f_{dt} dt$

Marder, i.e. the gas is purely two-dimensional in the sense that only the $(p=1)$ band needs to be considered, and k is a two-dimensional vector with the length $k = k_x^2 + k_y^2$. The most important quantity is the Fermi energy, which is determined by evaluating N at zero temperature: $n = N/A = k \leq k_F$ $D(k) dk = 2(2\pi)^{-2} k_F^0 2\pi k dk = k_F^2 2\pi \Rightarrow k_F = \sqrt{2\pi n}$ (2a)

Marder Condensed Matter Physics Solutions

Michael P. Marder. This Second Edition presents an updated review of the whole field of condensed matter physics. It consolidates new and classic topics from disparate sources, teaching not only about the effective masses of electrons in semiconductor crystals and band theory, but also about quasicrystals, dynamics of phase separation, why rubber is more floppy than steel, granular materials, quantum dots, Berry phases, the quantum Hall effect, and Luttinger liquids.
